PRELIMINARY AMENDMENTAssistant Commissioner for Patents
Washington, D.C. 20231

Sir:

Prior to examination, kindly amend the above-identified application as follows:

IN THE SPECIFICATION:

Kindly replace the paragraph beginning on page 2, line 26, with the following paragraph:

Other reflective antennas are known: EP 323 011 for example, discloses a transponder, which receives signals from a reader, modulates them, and reflects them back to a reader to pass the information contained in the transponder to the reader. First conductive material is disposed on the first surface of the dielectric member at a first end of the member. Second conductive material on the second opposite surface of the dielectric member at the second end of the member defines a dipole with the first material. The second material is preferably triangular in configuration. An electrical circuitry on the dielectric member produces reflected signals modulated at a particular frequency from the signal transmitted by the reader to pass information contained in the transponder to the reader. The dipole is electrically coupled with the conductive material and enhances an impedance match between the dipole and electrical circuitry. The conductive material has a first low impedance portion split into two parts connected in parallel to provide an
